

COLOUR VARIATIONS

Important information about your unpainted Troldtekt acoustic panels based on FUTURECEM

This information is specifically about acoustic panels in Natural Grey (FUTURECEM).

Troldtekt panels are made of wood wool and cement. Unpainted Troldtekt panels in Natural Grey (FUTURECEM) may show variations in colour – both across the individual panels and from panel to panel. Other natural building materials, such as wooden floors, bricks, concrete elements and in-situ cast concrete, have the same characteristics. The natural iridescence is an important aesthetic component of the overall architectural impression.

As with other untreated and unpainted building products, it is a good idea to mix/disperse the Troldtekt acoustic panels during installation to achieve an even distribution of the different shades of colour.

The raw materials affect the look

The wood in Troldtekt acoustic panels is a natural material, and several factors can affect the appearance and properties of the wood. One factor can be the conditions under which the wood has grown; when the tree was felled can also have an impact. Furthermore, water content and drying rate can play a role.

Cement is the binding agent in Troldtekt panels, and it is the cement that gives the panels their strength. Strengthening occurs during the setting process, when a chemical reaction between water and cement takes place. In addition to visible colour differences, dark and light edges may also appear at the ends of the panels, as well as efflorescence (salt deposits).

If a uniform colour tone is essential to your design, we recommend choosing painted Troldtekt panels.

Please note that you cannot submit complaints regarding visual colour differences if you choose unpainted Troldtekt panels.

Examples

The images show examples of the different looks that you can expect from unpainted Troldtekt panels in Natural Grey (FUTURECEM).
